**Low Power, 5V/3.3V,  $\mu$ P Reset, Active LOW, Open-Drain Output**

**General Description**

The ASM1233D-L/1233D/1233M are voltage supervisors with low-power, 5/3.3V  $\mu$ P Reset, with an active LOW, open-drain output. Maximum supply current over temperature is 15 $\mu$ A for 3.3V devices and 20 $\mu$ A for 5V devices.

The ASM1233D-L/1233D/1233M generates an active LOW reset signal whenever the monitored supply is out of tolerance. A precision reference and comparator circuit monitors power supply ( $V_{CC}$ ) level. The tolerance are 5%,10% and 15%. When an out-of-tolerance condition is detected, an internal power-fail signal is generated which forces an active LOW reset signal. After  $V_{CC}$  returns to an in-tolerance condition, the reset signal remains active for 350ms to allow the power supply and system microprocessor to stabilize.

The ASM1233D-L/1233D/1233M is designed with an open-drain output stage and operates over the extended industrial temperature range. These devices are available in compact SOT-223, SO-8 and TO-92 packages.

Other low power products in this family include ASM1810/11/12/15/16/17.

**Key Features**

- Low Supply Current
  - 15 $\mu$ A maximum ( $\leq$ 3.6V), 20 $\mu$ A maximum (5.5V)
- Automatically restarts a microprocessor after power failure
- 350ms reset delay after  $V_{CC}$  returns to an in-tolerance condition
- Active LOW power-up reset, 5k $\Omega$  internal pull-up
- Precision temperature-compensated voltage reference and comparator
- Eliminates external components
- Low-cost SOT-223/SO-8/TO-92 packages
- Operating temperature: -40 $^{\circ}$ C to +85 $^{\circ}$ C

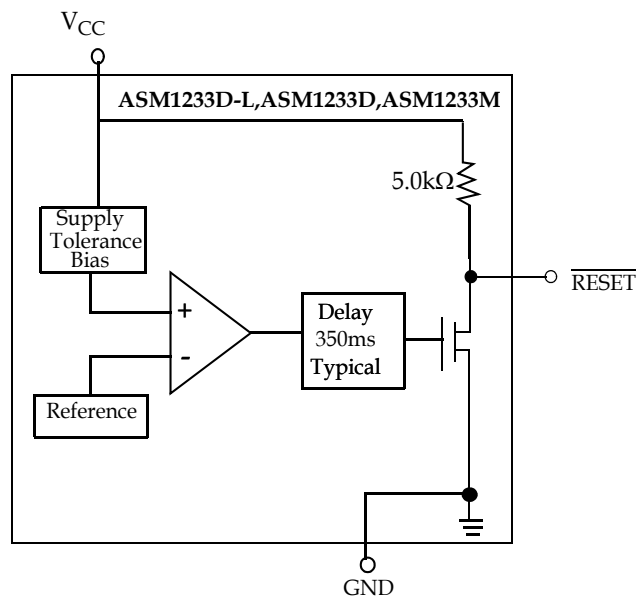

**Applications**

- Set-top boxes
- Cellular phones
- PDAs
- Energy management systems
- Embedded control systems
- Printers
- Single board computers

**Application Information**

**Operation - Power Monitor**

The ASM1233D-L/1233D/1233M detects out-of-tolerance power supply conditions. It resets a processor during power-up, power-down and generates a reset to the system processor when the monitored power supply voltage is below the reset threshold. When an out-of-tolerance  $V_{CC}$  voltage is detected, the  $\overline{\text{RESET}}$  signal is asserted. On power-up,  $\overline{\text{RESET}}$  is kept active (LOW) for approximately 350ms after the power supply voltage has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before  $\overline{\text{RESET}}$  is released.

**Electrical Characteristics**

Unless otherwise noted,  $V_{CC} = 5V \pm 10\%$  and specifications are over the operating temperature range of  $-40^{\circ}C$  to  $+85^{\circ}C$ . All voltages are referenced to ground.
