## FUNCTIONS

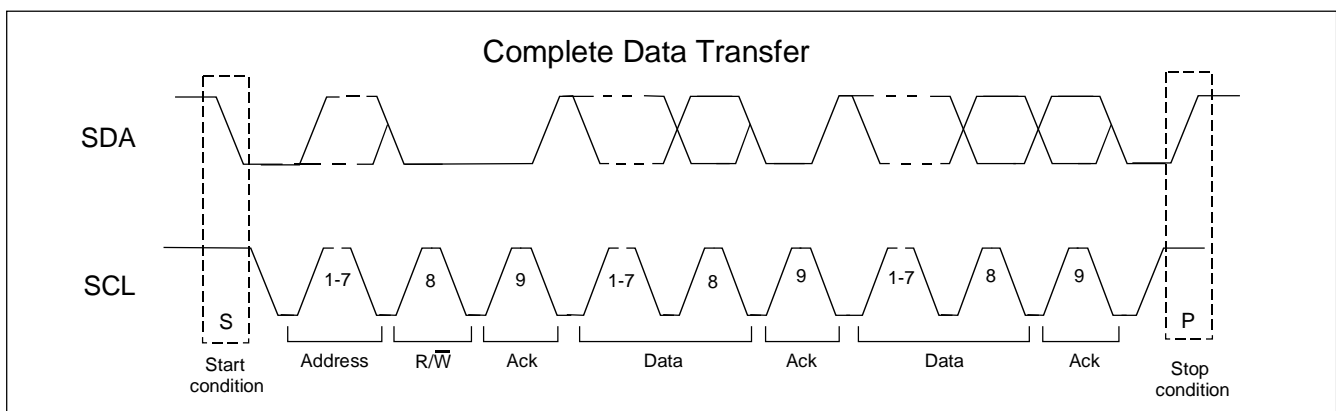

### ◆ I<sup>2</sup>C - bus

The MAS9181 I<sup>2</sup>C-bus interface is a receiver- only slave. Data is accepted from the I<sup>2</sup>C - bus in the following format.

S	0 1 0 0 A2 A1 A0 0	A	I3 I2 I1 I0 SD SC SB SA	A	D7 D6 D5 D4 D3 D2 D1	A P
	Address byte		Instruction byte		First data byte	

S	Start condition	A2, A1, A0	programmable address bits
P	Stop condition	I3, I2, I1, I0	instruction bits
A	Acknowledgement	SD, SC, SB, SA	sub-address bits
		D7, D6, D5, D4, D3, D2, D2, D1, D0	data bits

## FUNCTIONS

---

### ◆ Address Byte

Valid addresses are 40, 42, 44, 46, 48, 4A, 4C, 4E(hex), depending on the programming of bits A2, A1 and A0. With these addresses, up to eight MAS9181 ICs can be operated independently from one I<sup>2</sup>C-bus. No other addresses are acknowledged by the MAS9181. The

address inputs A0, A1 and A2 are programmed by connection to GND for An = 0 or to VDD for An = 1. If the inputs are left floating, An = 1 will result. For MAS9181CS, A2 is always 1.

### ◆ Instruction and data bytes

Valid instructions from 00 to 0F and F0 to FF (hex); MAS9181 will not respond to other instruction value, but will still generate an acknowledgement. Instructions 00 to 0F cause auto-incrementing of the sub-address (bits SD to SA) when more than one data byte is sent within one transmission. With auto-incrementing, the first data byte is written into the DAC addressed by bits SD to SA and then the sub-address is automatically incremented by one position for the next databyte in the series. Auto-

incrementing does not occur with instructions F0 to FF. The DAC addressed by the sub-address will always receive the data if more than one data byte is sent. Valid sub-addresses (bits SD to SA) are 0 to 7 (hex) relating numerically to DAC0 to DAC7. When the auto-incrementing function is used, the sub-address will sequence through all possible values (0 to F, 0 to F, etc.). While the sub-address is between 8 and F no DAC outputs change.

### ◆ I<sup>2</sup>C - bus

Input SCL (pin 4) and input/output SDA (pin 3) conform to I<sup>2</sup>C-bus specifications. Pins 3 and 4 are protected against voltage pulses by internal zener diodes

connected to the ground plane and therefore the normal bus line voltage shall not exceed 5.5V.

### ◆ Input Vmax

Input Vmax (pin 2) provides a means of comprising the output voltage swing of the DACs. The maximum DAC output voltage is restricted to approximately Vmax while

the 8-bit resolution is maintained, therefore giving a finer voltage resolution of smaller output swings.
