## Handling Precautions

Permanent damage to the MASW6020G may occur if the following precautions are not adhered to:

- A. Cleanliness – The MASW6020G should be handled in a clean environment. DO NOT attempt to clean unit after the MASW6020G is installed.
- B. Static Sensitivity – All chip handling equipment and personnel should be DC grounded.
- C. Transient – Avoid instrument and power supply transients while bias is applied to the MASW6020G. Use shielded signal and bias cables to minimize inductive pick-up.
- D. Bias – Apply voltage to either control port A/B or only when the other is grounded. Neither port should be allowed to “float.”
- E. General Handling – It is recommended that the MASW6020G chip be handled along the long side of the die with a sharp pair of bent tweezers. DO NOT touch the surface of the chip with fingers or tweezers.

## Mounting

The MASW6020G is back-metallized with Pd/Ni/Au (100/1,000/30,000Å) metallization. It can be die-mounted with AuSn eutectic preforms or with thermally conductive epoxy. The package surface should be clean and flat before attachment.

### Eutectic Die Attach:

- A. A 80/20 gold/tin preform is recommended with a work surface temperature of approximately 255°C and a tool temperature of 265°C. When hot 90/10 nitrogen/hydrogen gas is applied, tool tip temperature should be approximately 290°C.
- B. DO NOT expose the MASW6020G to a temperature greater than 320°C for more than 20 seconds. No more than 3 seconds of scrubbing should be required for attachment.

### Epoxy Die Attach:

- A. Electrically conductive epoxy must be used.
- B. Apply a minimum amount of epoxy and place the MASW6020G into position. A thin epoxy fillet should be visible around the perimeter of the chip.
- C. Cure epoxy per manufacturer's recommended schedule.

## Wire Bonding

- A. Ball or wedge bond with 1.0 mil diameter pure gold wire. Thermosonic wirebonding with a nominal stage temperature of 150°C and a ball bonding force of 40 to 50 grams or wedge bonding force of 18 to 22 grams is recommended. Ultrasonic energy and time should be adjusted to the minimum levels to achieve reliable wirebonds.
- B. Wirebonds should be started on the chip and terminated on the package.
