## Description

The IDT709359/49 is a high-speed 8/4K x 18 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times.

With an input data register, the IDT709359/49 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by  $\overline{CE_0}$  and  $CE_1$ , permits the on-chip circuitry of each port to enter a very low standby power mode. Fabricated using IDT's CMOS high-performance technology, these devices typically operate on only 925mW of power.

### NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2). This parameter is guaranteed by device characterization, but is not production tested.
2. The Pipelined output parameters (t<sub>CYC2</sub>, t<sub>CD2</sub>) to either the Left or Right ports when  $\overline{FT}/PIPE = V_{IH}$ . Flow-Through parameters (t<sub>CYC1</sub>, t<sub>CD1</sub>) apply when  $\overline{FT}/PIPE = V_{IL}$  for that port.
3. All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ( $\overline{OE}$ ),  $\overline{FT}/PIPE_R$  and  $\overline{FT}/PIPE_L$ .

### NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2.  $\overline{\text{OE}}$  is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
3.  $\overline{\text{ADS}} = \text{V}_{\text{IL}}$ ,  $\text{CNTEN}$  and  $\text{CNRST} = \text{V}_{\text{IH}}$ .
4. The output is disabled (High-Impedance state) by  $\overline{\text{CE}}_0 = \text{V}_{\text{IH}}$ ,  $\text{CE}_1 = \text{V}_{\text{IL}}$ , following the next rising edge of the clock. Refer to Truth Table 1.
5. Addresses do not have to be accessed sequentially since  $\overline{\text{ADS}} = \text{V}_{\text{IL}}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
6. If  $\overline{\text{UB}}$  or  $\overline{\text{LB}}$  was HIGH, then the Upper Byte and/or Lower Byte of  $\text{DATAOUT}$  for  $\text{Qn} + 2$  would be disabled (High-Impedance state).
7. "X" here denotes Left or Right port. The diagram is with respect to that port.

7. All timing is the same for both Left and Right ports. Port "A" may be either Left or Right port. Port "B" is the opposite from Port "A".

4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

### NOTES:

1.  $\overline{CE}_0$ ,  $\overline{OE}$ ,  $\overline{UB}$ , and  $\overline{LB} = V_{IL}$ ;  $CE_1$ ,  $R/\overline{W}$ , and  $\overline{CNTRST} = V_{IH}$ .
2. If there is no address change via  $\overline{ADS} = V_{IL}$  (loading a new address) or  $\overline{CNTEN} = V_{IL}$  (advancing the address), i.e.  $\overline{ADS} = V_{IH}$  and  $\overline{CNTEN} = V_{IH}$ , then the data output remains constant for subsequent clocks.

2.  $\overline{CE_0}$ ,  $\overline{UB}$ ,  $\overline{LB} = V_{IL}$ ;  $CE_1 = V_{IH}$ .
3. The "Internal Address" is equal to the "External Address" when  $\overline{ADS} = V_{IL}$  and equals the counter output when  $\overline{ADS} = V_{IH}$ .
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle.
7.  $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An+1'. The transition shown indicates the time required for the counter to advance. The 'An+1' Address is written to during this cycle.

## A Functional Description

The IDT709359/49 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

$\overline{CE_0} = V_{IH}$  or  $CE_1 = V_{IL}$  for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT709359/49's for depth expansion configurations. When the Pipelined output mode is enabled, two cycles are required with  $\overline{CE_0} = V_{IL}$  and  $CE_1 = V_{IH}$  to re-activate the outputs.

## Depth and Width Expansion

The IDT709359/49 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT709359/49 can also be used in applications requiring expanded width, as indicated in Figure 4. Since the banks are allocated at the discretion of the user, the external controller can be set up to drive the input signals for the various devices as required to allow for 36-bit or wider applications.
