# 18-bit latched transceiver with 16-bit parity generator/checker (3-State)

**74ABT16899**  
**74ABTH16899**

## FEATURES

- Symmetrical (A and B bus functions are identical)
- Selectable generate parity or "feed-through" parity for A-to-B and B-to-A directions
- Independent transparent latches for A-to-B and B-to-A directions
- Selectable ODD/EVEN parity
- Continuously checks parity of both A bus and B bus latches as  $\overline{\text{ERRA}}$  and  $\overline{\text{ERRB}}$
- Open-collector  $\overline{\text{ERR}}$  output
- Ability to simultaneously generate and check parity
- Can simultaneously read/latch A and B bus data
- Output capability: +64 mA/−32 mA
- Latch-up protection exceeds 500mA per Jedec Std 17
- ESD protection exceeds 2000 V per MIL STD 883 Method 3015 and 200 V per Machine Model
- Power up 3-State
- Power-up reset
- Live insertion/extraction permitted
- Bus-hold data inputs eliminate the need for external pull-up resistors to hold unused inputs

## DESCRIPTION

The 74ABT/H16899 is a 16-bit to 16-bit parity transceiver with separate transparent latches for the A bus and B bus. Either bus can generate or check parity. The parity bit can be fed-through with no change or the generated parity can be substituted with the  $\overline{\text{SEL}}$  input.

## QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS $T_{\text{amb}} = 25^{\circ}\text{C}$ ; $\text{GND} = 0\text{V}$	TYPICAL	UNIT
$t_{\text{PLH}}$ $t_{\text{PHL}}$	Propagation delay An to Bn or Bn to An	$C_L = 50\text{pF}$ ; $V_{\text{CC}} = 5\text{V}$	2.7	ns
$t_{\text{PLH}}$ $t_{\text{PHL}}$	Propagation delay An to $\overline{\text{ERRA}}$	$C_L = 50\text{pF}$ ; $V_{\text{CC}} = 5\text{V}$	5.0	ns
$C_{\text{IN}}$	Input capacitance	$V_I = 0\text{V}$ or $V_{\text{CC}}$	4	pF
$C_{\text{I/O}}$	Output capacitance	Outputs disabled; $V_O = 0\text{V}$ or $V_{\text{CC}}$	7	pF
$I_{\text{CCZ}}$	Quiescent supply current	Outputs disabled; $V_{\text{CC}} = 5.5\text{V}$	500	$\mu\text{A}$
$I_{\text{CCL}}$		Output Low; $V_{\text{CC}} = 5.5\text{V}$	10.5	mA

## ORDERING INFORMATION

56-Pin Plastic TSSOP Type II	−40°C to +85°C	74ABTH16899 DGG	BH16899 DGG	SOT364-1

Parity error checking of the A and B bus latches is continuously provided with  $\overline{\text{ERRA}}$  and  $\overline{\text{ERRB}}$ , even with both buses in 3-State.

The 74ABT/H16899 features independent latch enables for the A and B bus latches, a select pin for ODD/EVEN parity, and separate error signal output pins for checking parity.

## FUNCTIONAL DESCRIPTION

The 74ABT/H16899 has three principal modes of operation which are outlined below. All modes apply to both the A-to-B and B-to-A directions.

### Transparent latch, Generate parity, Check A and B bus parity:

Bus A (B) communicates to Bus B (A), parity is generated and passed on to the B (A) Bus as BPAR (APAR). If LEA and LEB are High and the Mode Select ( $\overline{\text{SEL}}$ ) is Low, the parity generated from A0-A7 and B0-B7 can be checked and monitored by  $\overline{\text{ERRA}}$  and  $\overline{\text{ERRB}}$ . (Fault detection on both input and output buses.)

### Transparent latch, Feed-through parity, Check A and B bus parity:

Bus A (B) communicates to Bus B (A) in a feed-through mode if  $\overline{\text{SEL}}$  is High. Parity is still generated and checked as  $\overline{\text{ERRA}}$  and  $\overline{\text{ERRB}}$  and can be used as an interrupt to signal a data/parity bit error to the CPU.

### Latched input, Generate/Feed-through parity, Check A (and B) bus parity:

Independent latch enables (LEA and LEB) allow other permutations of:

- Transparent latch / 1 bus latched / both buses latched
- Feed-through parity / generate parity
- Check in bus parity / check out bus parity / check in and out bus parity

## ABSOLUTE MAXIMUM RATINGS<sup>1, 2</sup>

SYMBOL	PARAMETER	CONDITIONS	RATING	UNIT
$V_{CC}$	DC supply voltage		-0.5 to +7.0	V
$I_{IK}$	DC input diode current	$V_I < 0$	-18	mA
$V_I$	DC input voltage <sup>3</sup>		-1.2 to +7.0	V
$I_{OK}$	DC output diode current	$V_O < 0$	-50	mA
$V_{OUT}$	DC output voltage <sup>3</sup>	output in Off or High state	-0.5 to +5.5	V
$I_{OUT}$	DC output current	output in Low state	128	mA
		output in High state	-64	
$T_{stg}$	Storage temperature range		-65 to 150	°C

### NOTES:

- Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 150°C.
- The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

## RECOMMENDED OPERATING CONDITIONS

SYMBOL	PARAMETER	LIMITS		UNIT
		Min	Max	
$V_{CC}$	DC supply voltage	4.5	5.5	V

ΔI <sub>CC</sub>	Additional supply current per input pin <sup>2</sup>		V <sub>CC</sub> = 5.5V; one input at 3.4V, other inputs at V <sub>CC</sub> or GND		0.2	1.5		1.5	mA

### NOTES:

- Not more than one output should be tested at a time, and the duration of the test should not exceed one second.
- This is the increase in supply current for each input at 3.4V.
- For valid test results, data must not be loaded into the flip-flops (or latches) after applying the power.
- This parameter is valid for any V<sub>CC</sub> between 0V and 2.1V, with a transition time of up to 10msec. From V<sub>CC</sub> = 2.1V to V<sub>CC</sub> = 5V ± 10%, a transition time of up to 100μsec is permitted.
- This is the bus hold overdrive current required to force the input to the opposite logic state.

## Definitions

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

**Limiting values definition** — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## Disclaimers

**Life support** — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

**Right to make changes** — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
